CASE #11

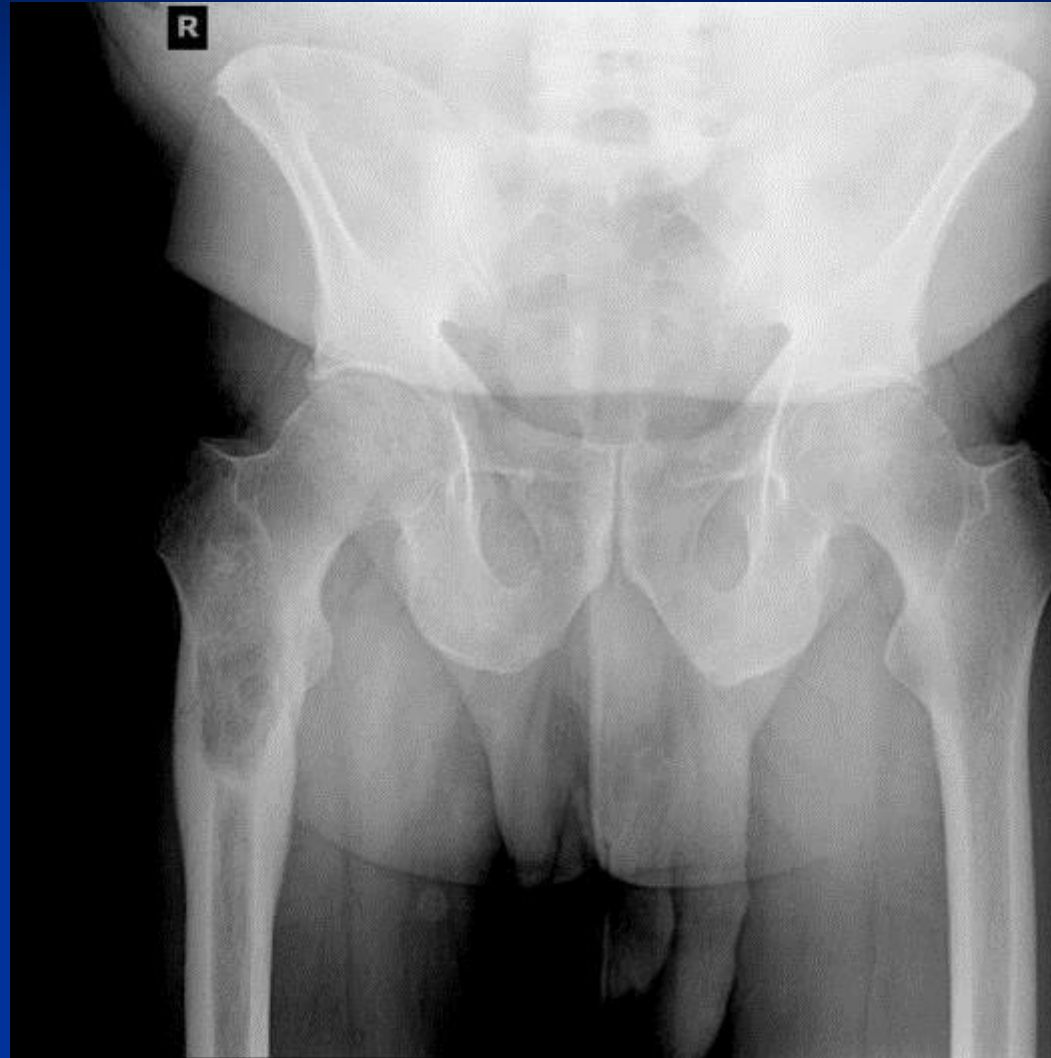

- A fairly active 62 year old male complained of right hip pain. After imaging, a lytic lesion was discovered in his right proximal femur. Physically, the mass was palpable. He had no recall of an accident or trauma, but he noticed pain after walking on the treadmill. Pain has increased over a span of two months. MR showed two lesions, one in the subtrochanteric area and one in his intertrochanteric area.

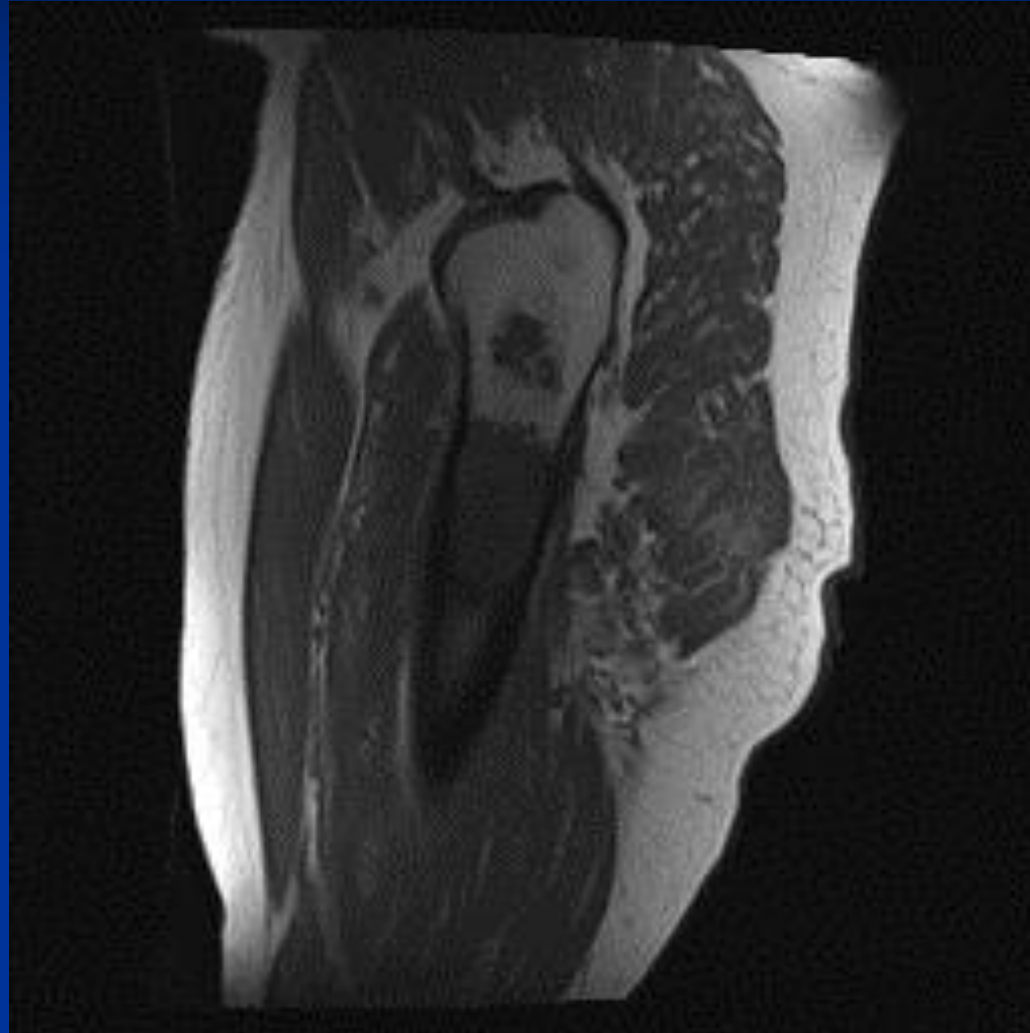

XR Unilateral

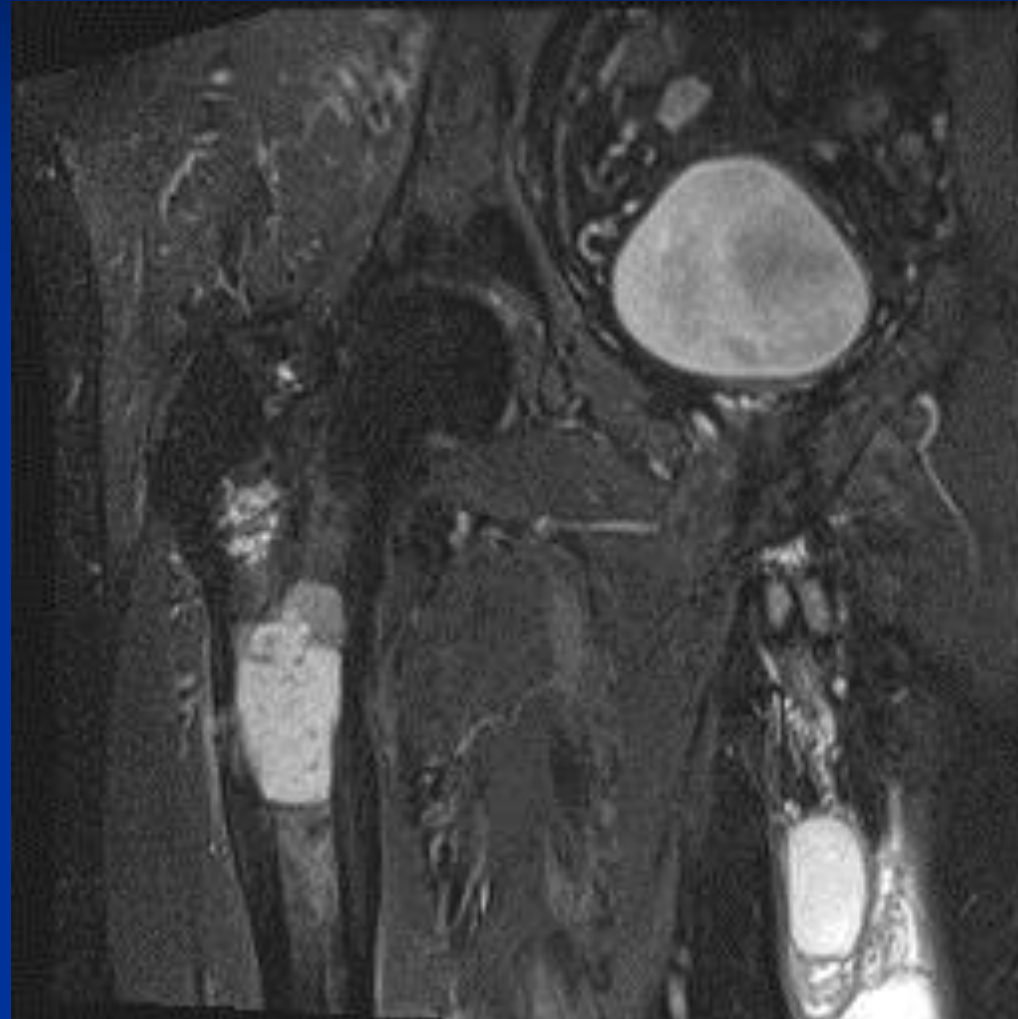

XR Lumbosacral

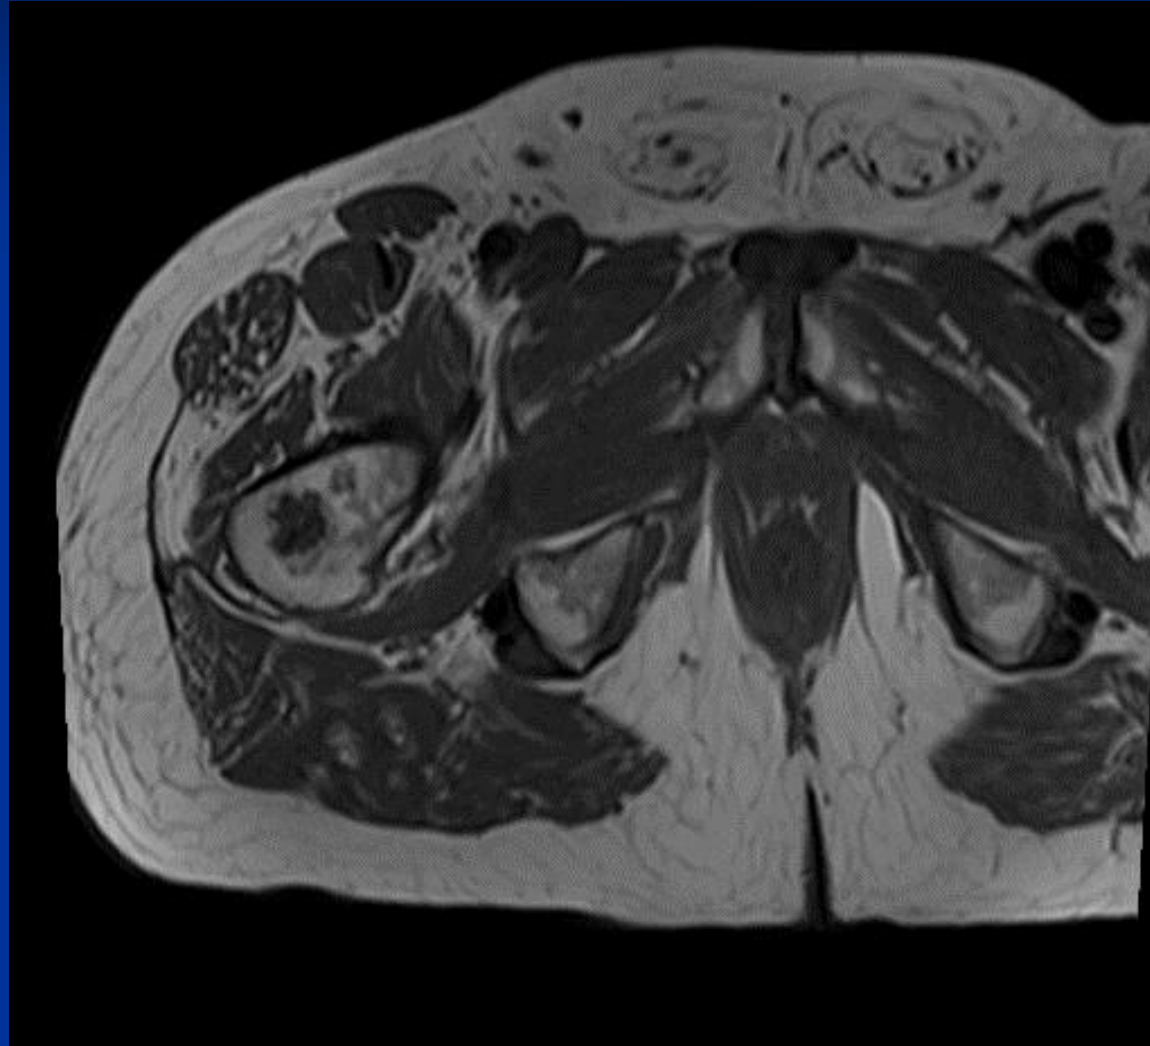

T-1 Sagittal

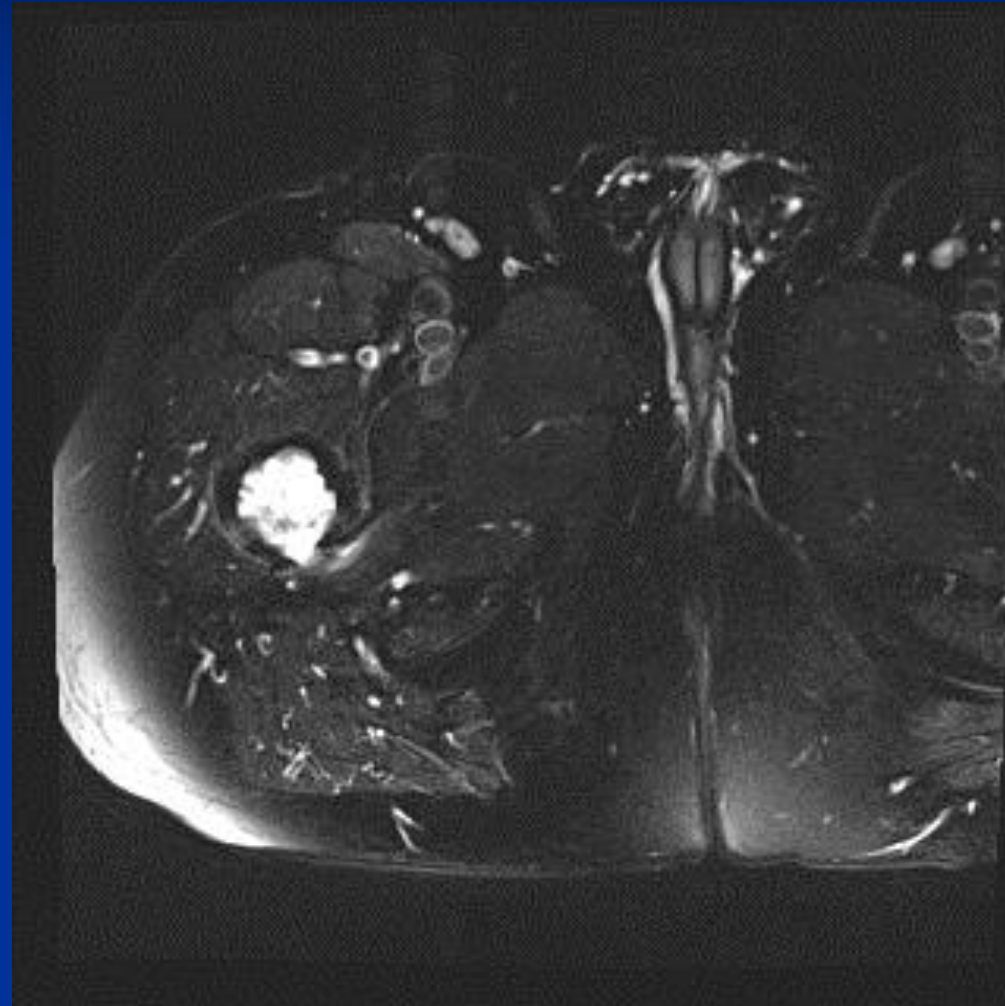

COR STIR

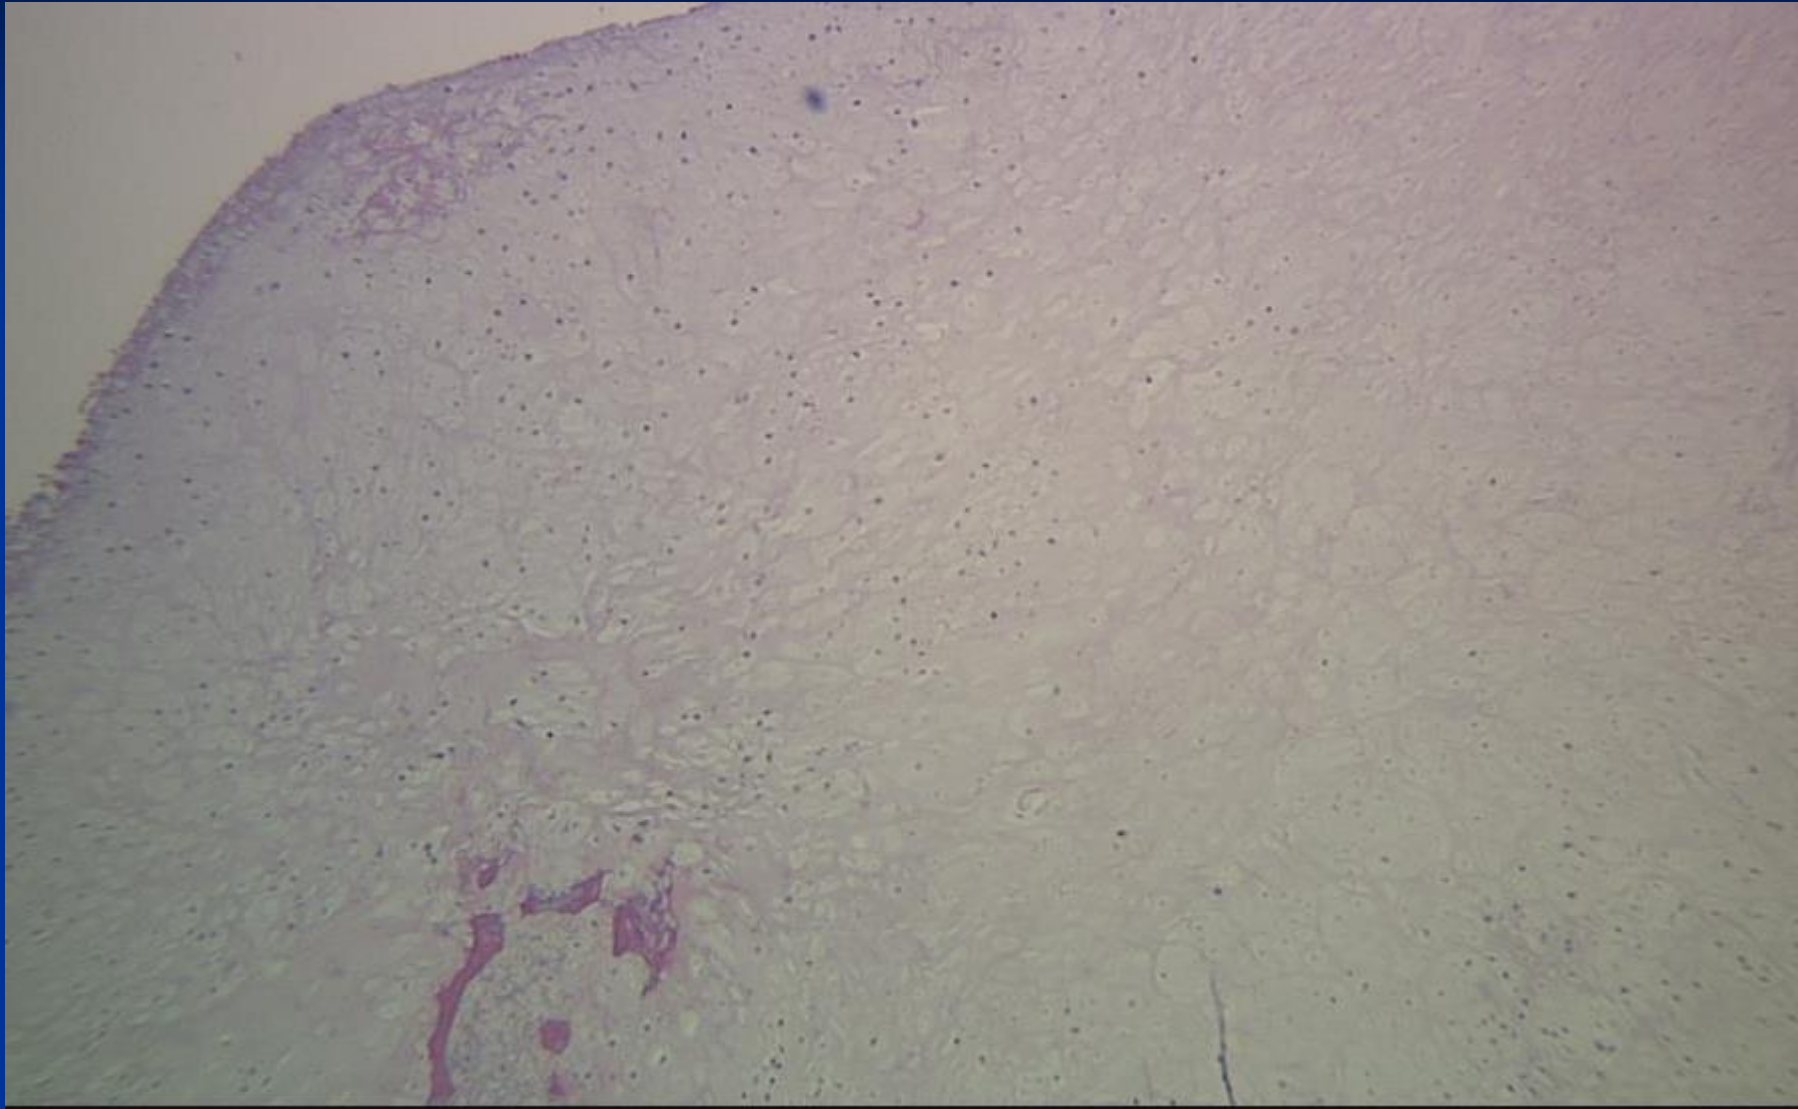

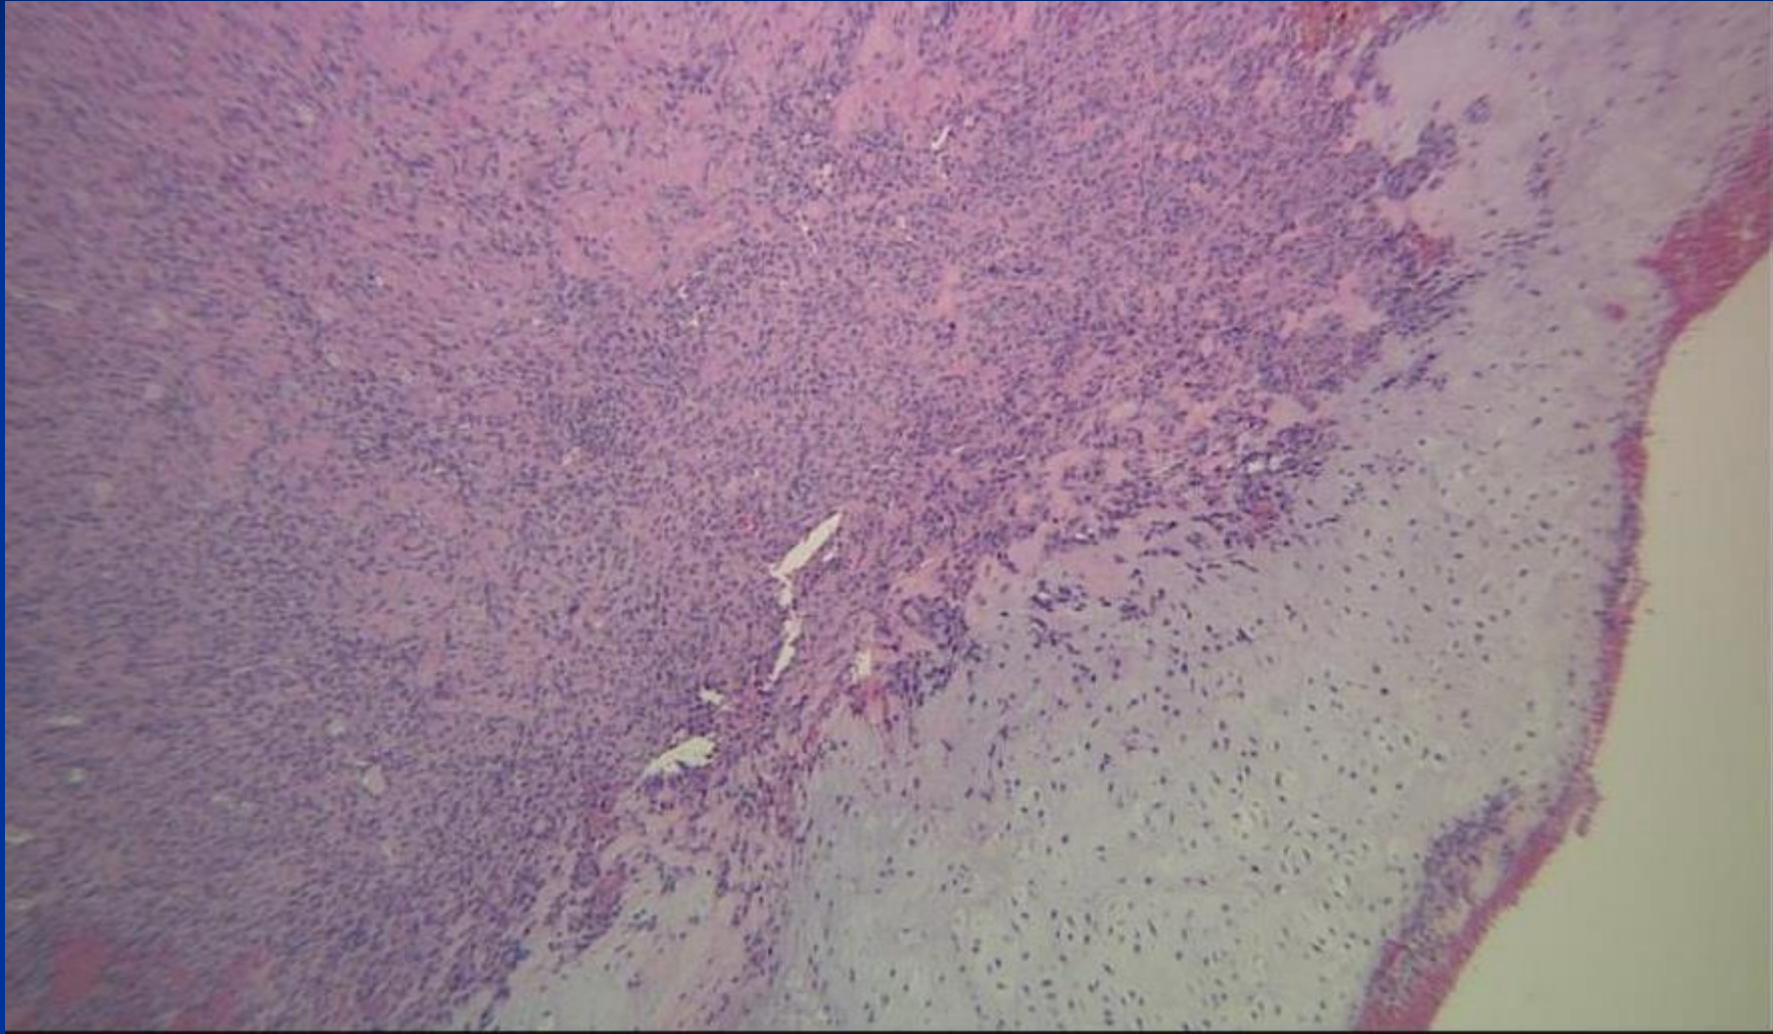

Axial T-1

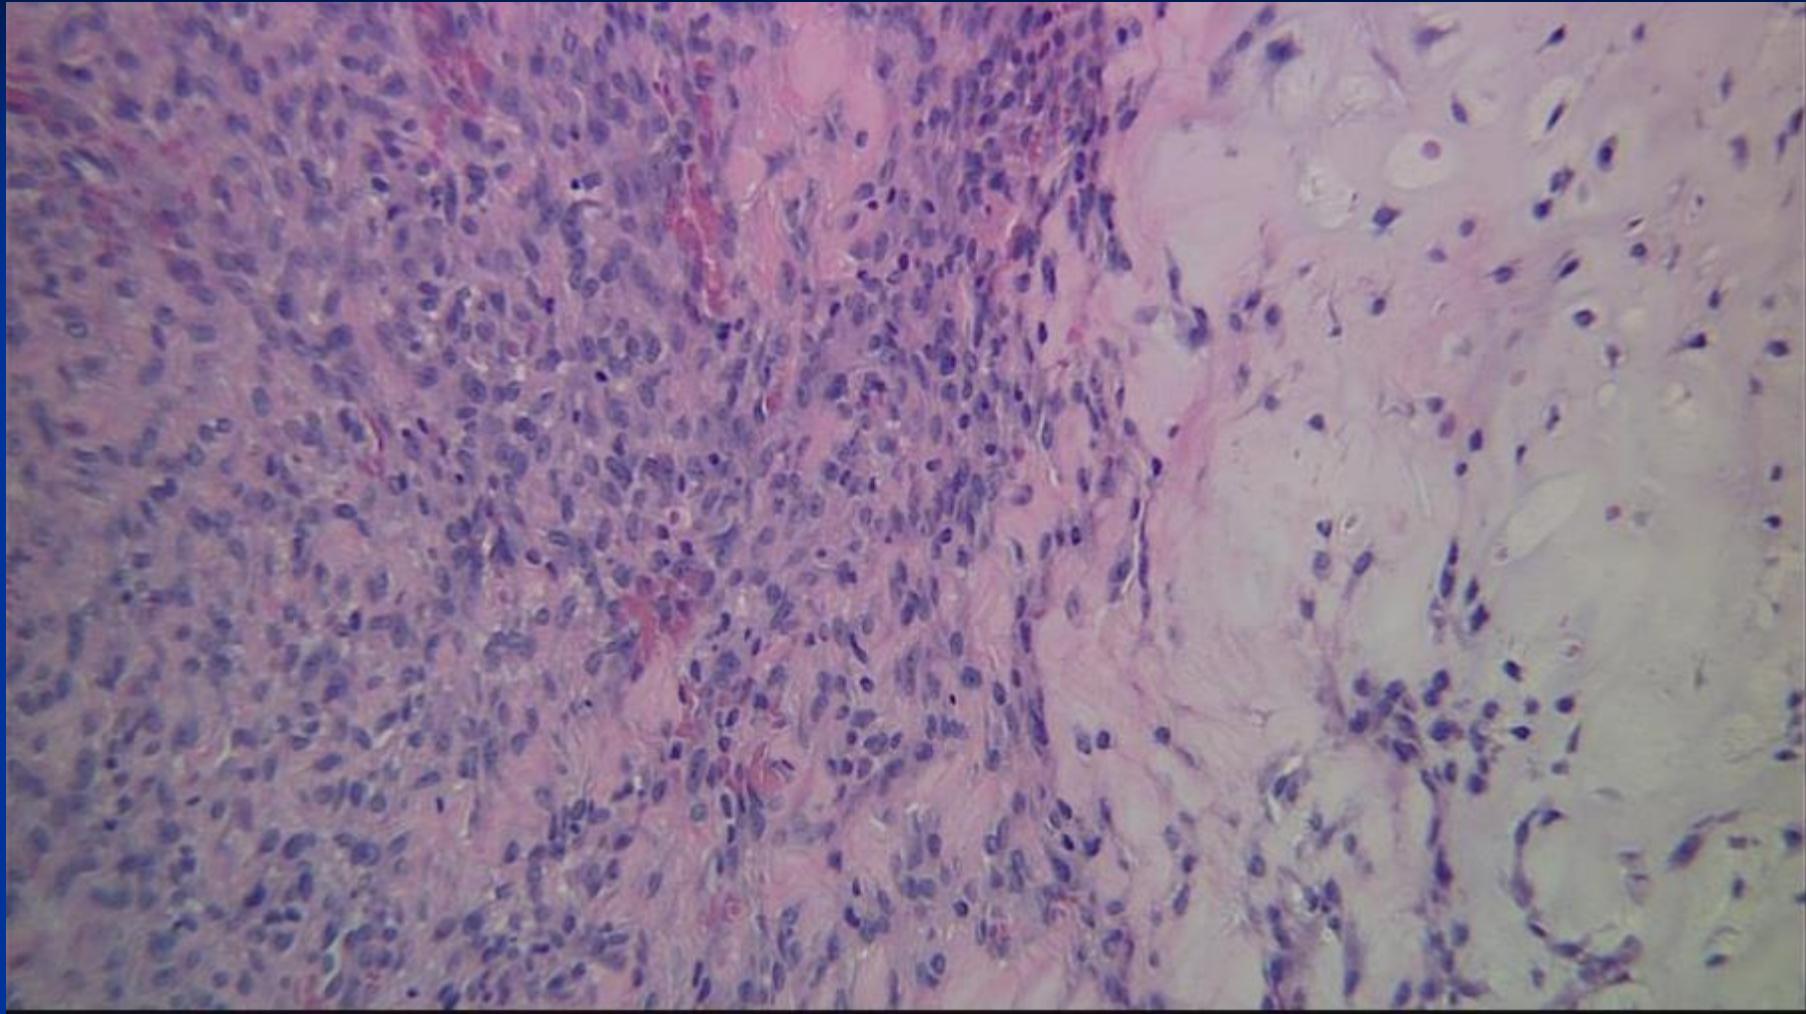

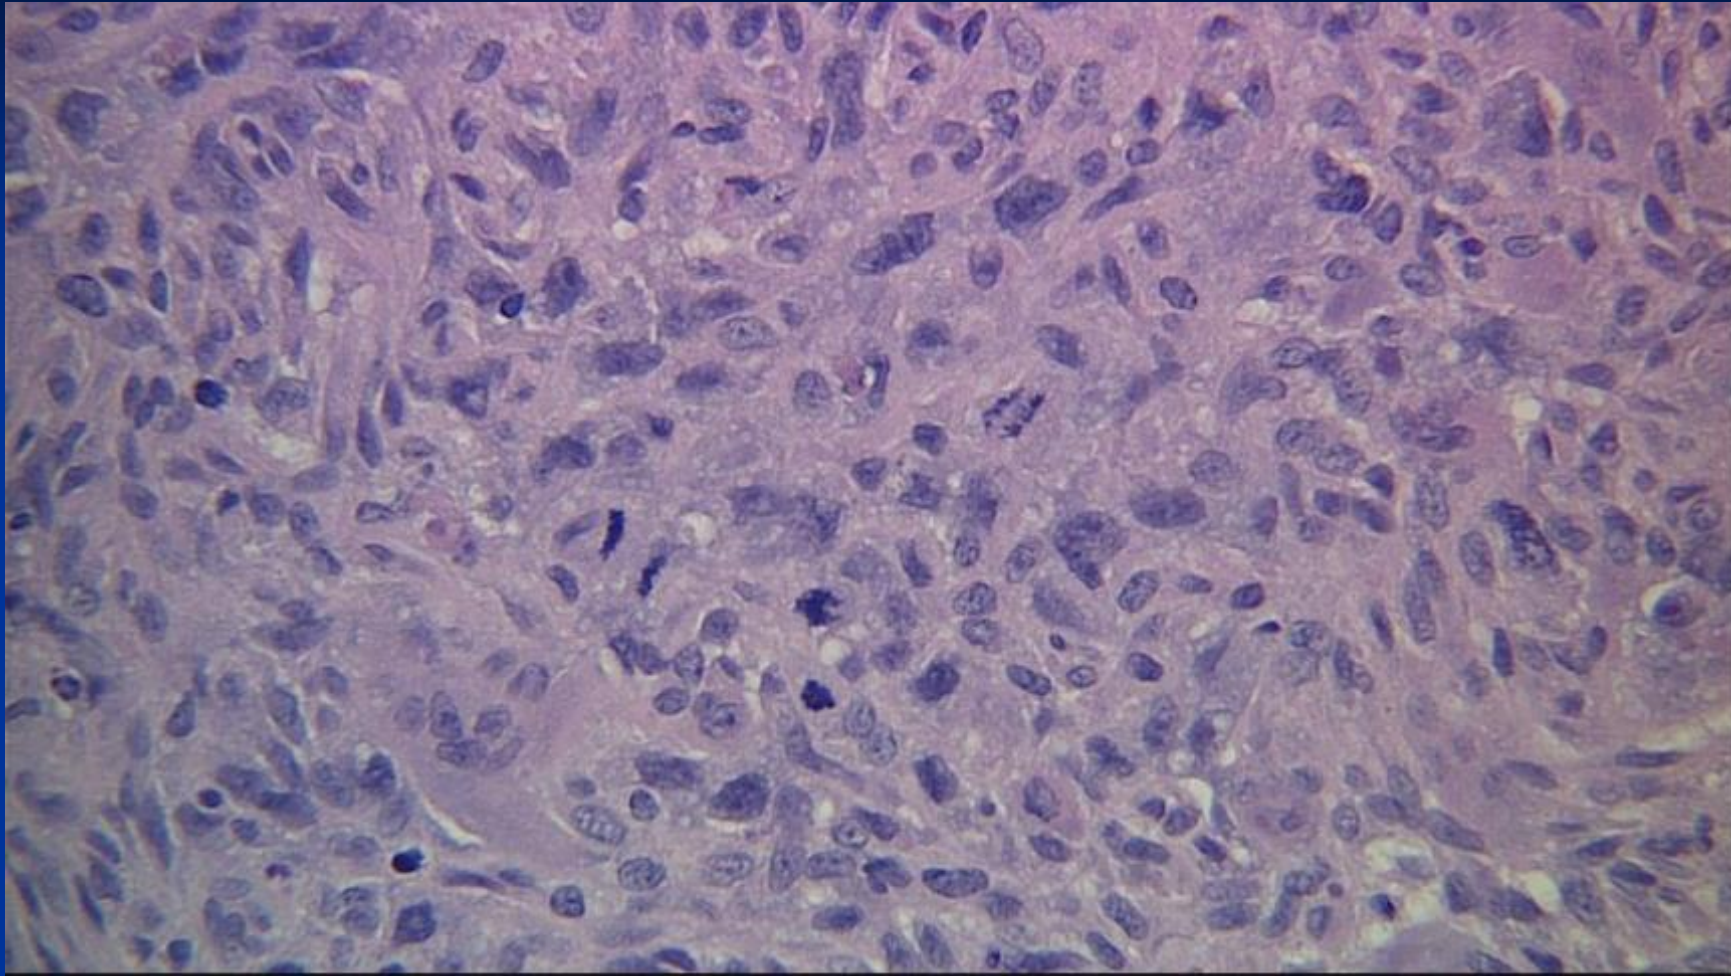

Axial T-2 FS

*Diagnosis Next

Wittig Orthopedic Oncology

Dedifferentiated Chondrosarcoma

CASE #12

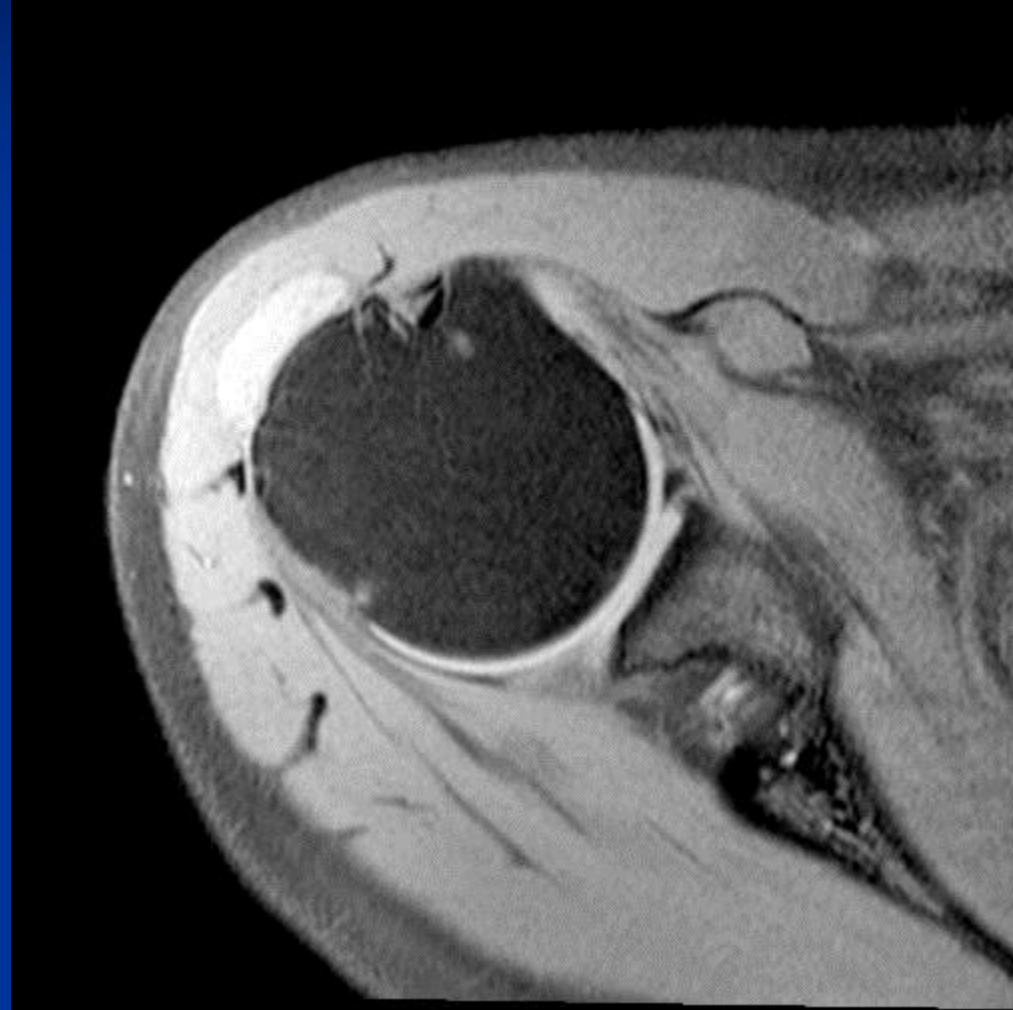

- A 38 year old woman presented with a small painless, mobile, non-tender mass in her right anterior shoulder that was first noticed 3 months ago. The mass has not enlarged. She denies pain, fever, chills, numbness, tingling, and weakness. MRI showed a mass in the subdeltoid bursa. The mass was removed.

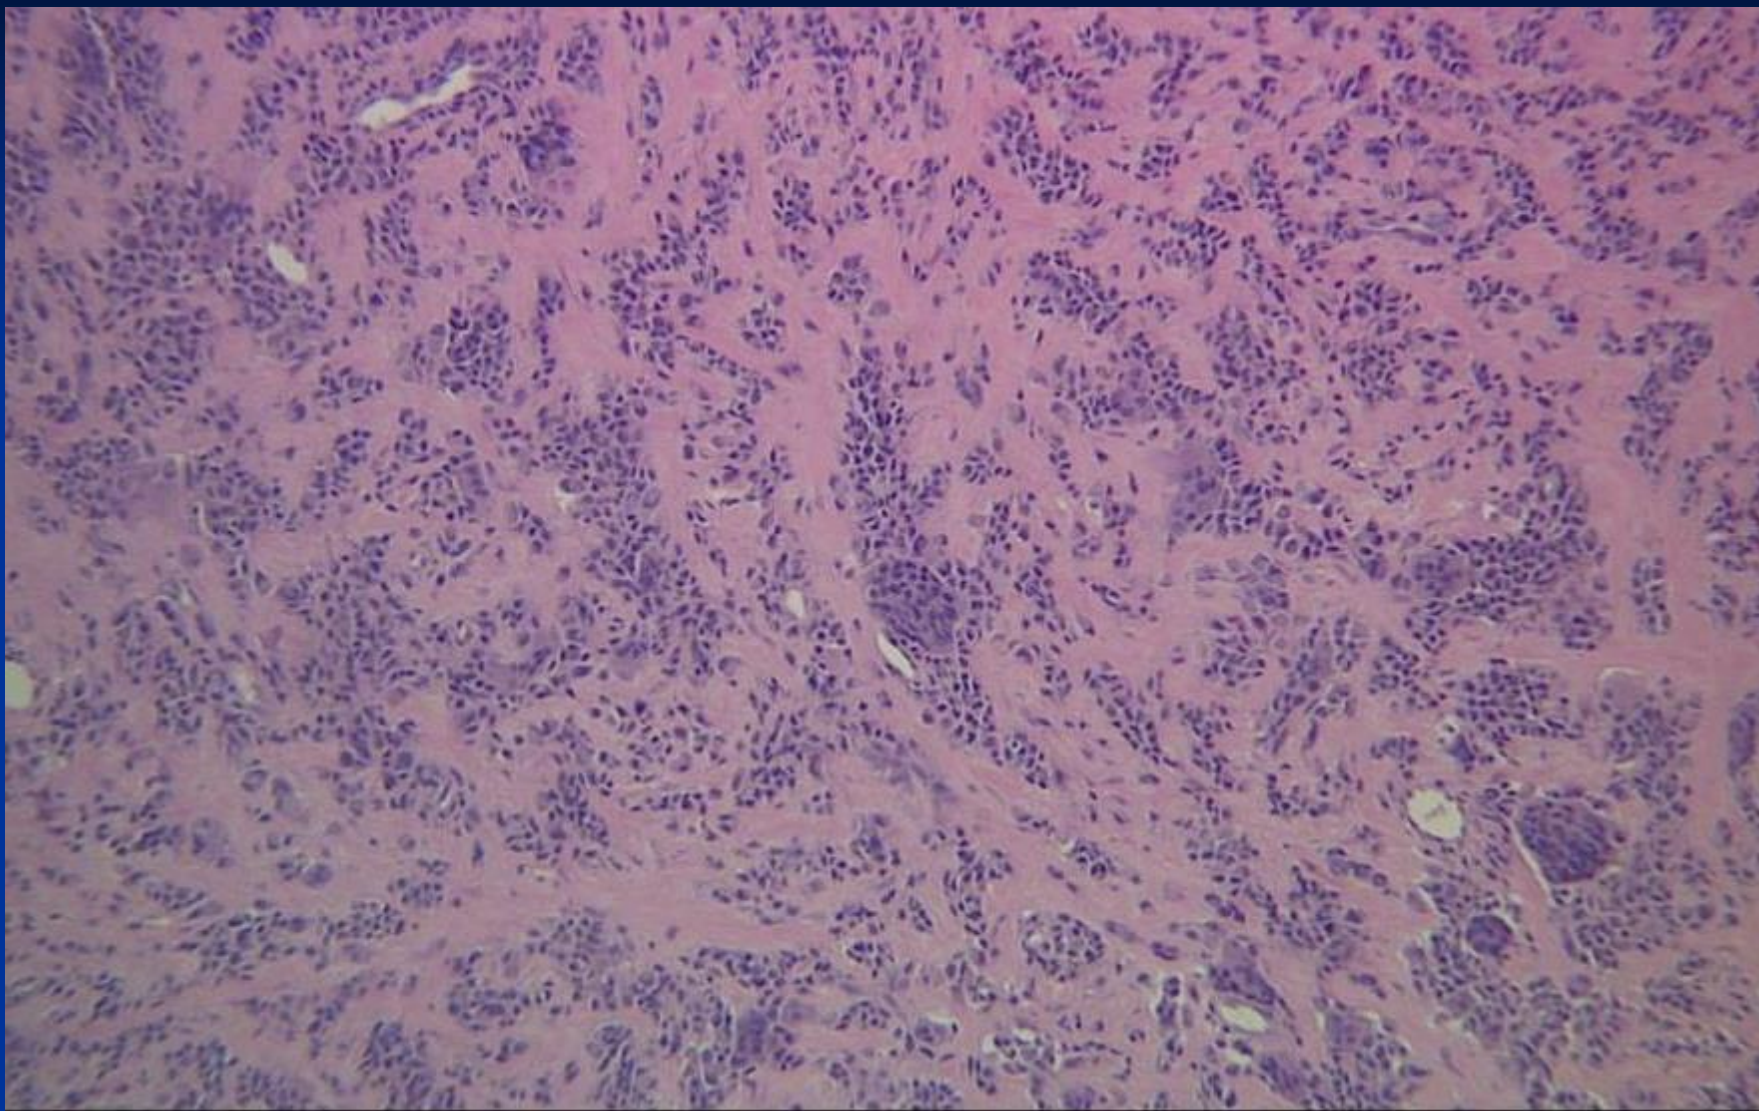

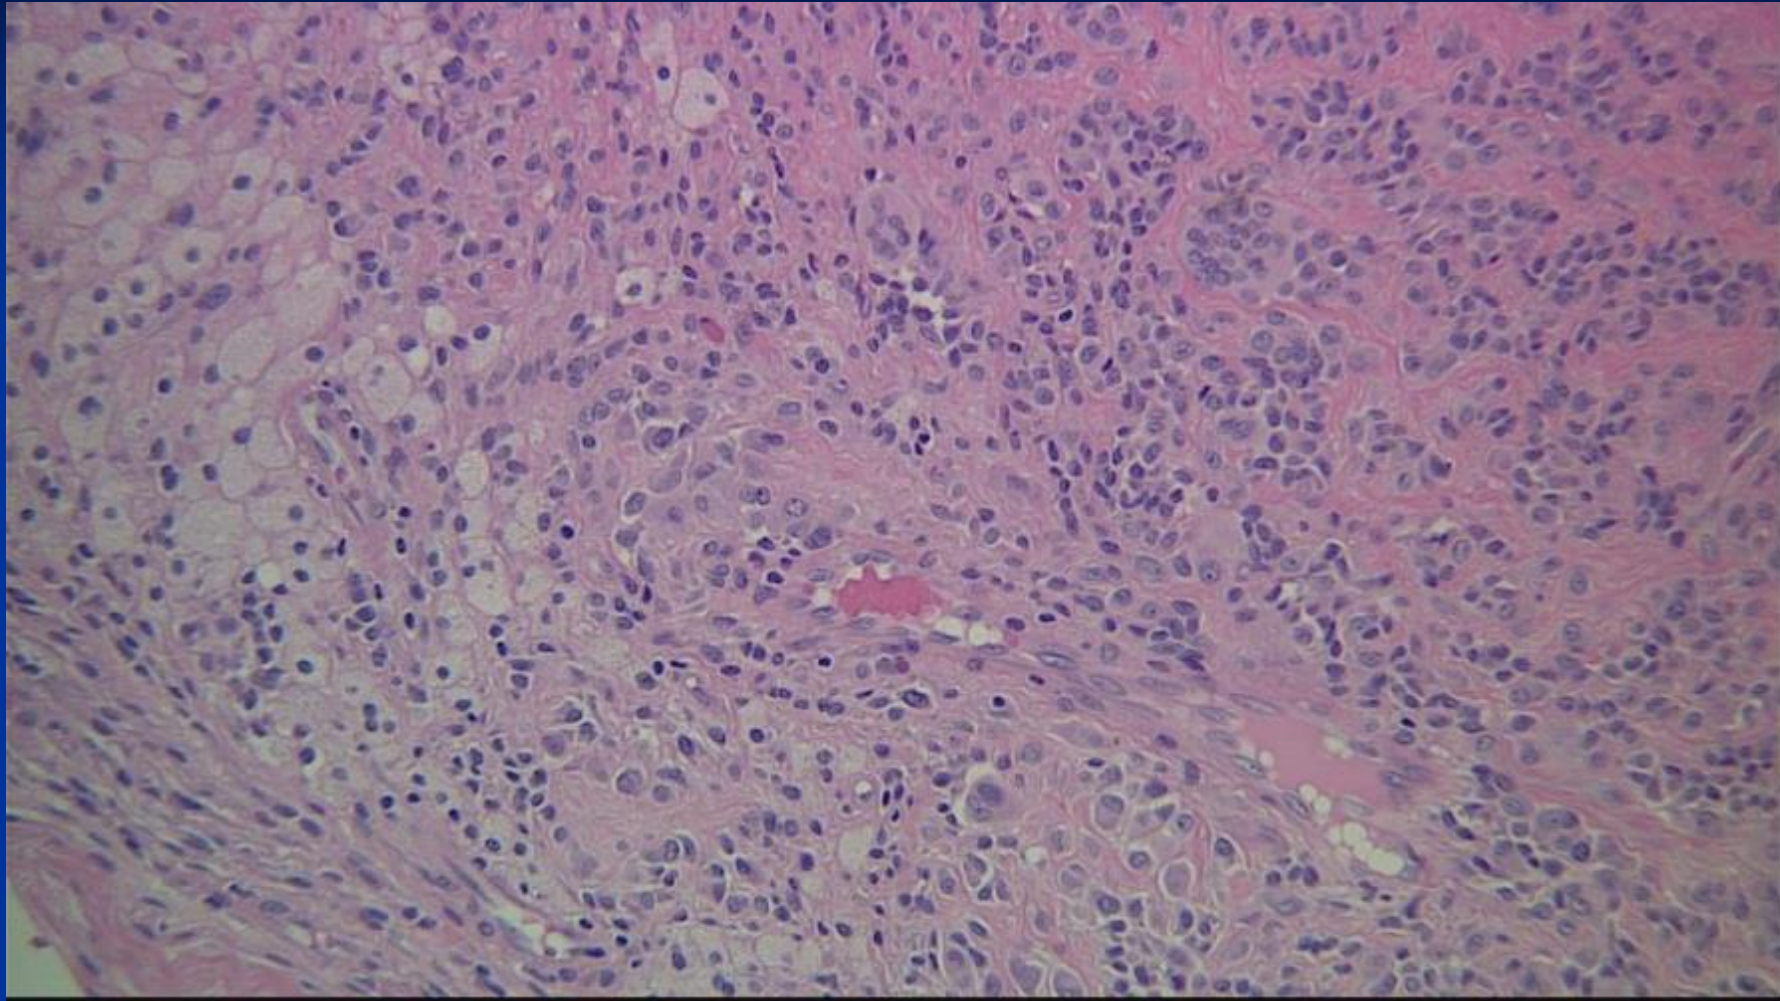

COR T-2 FS Clear

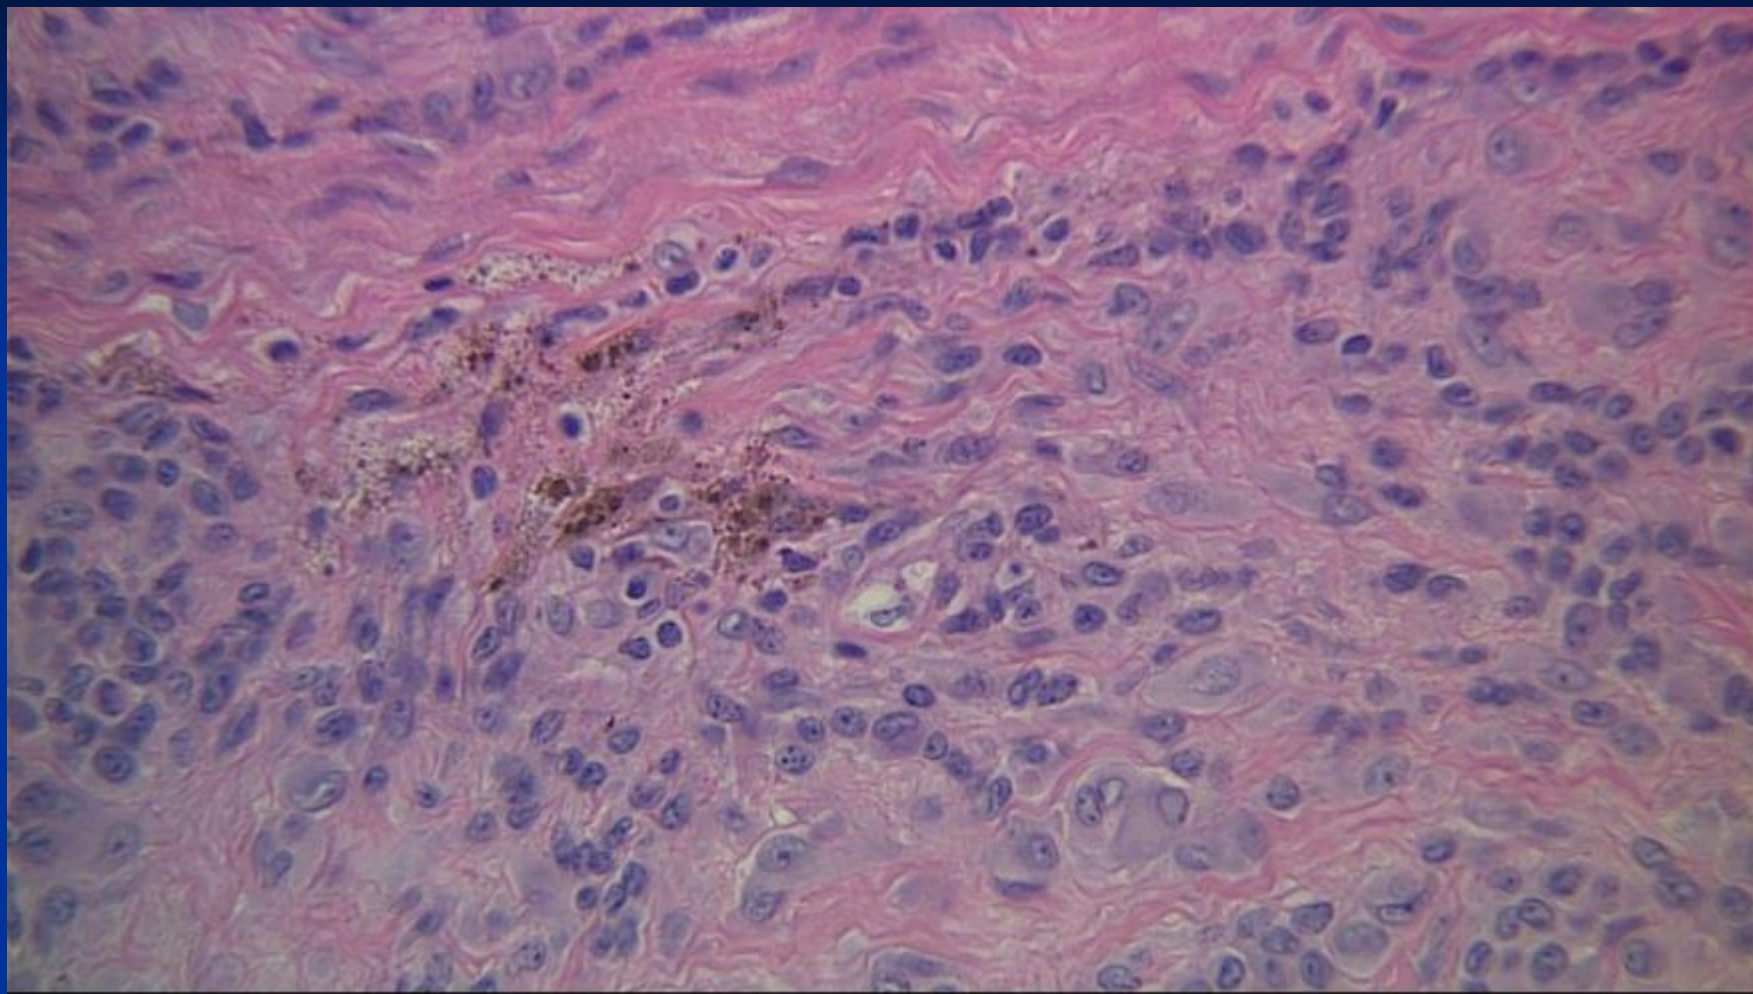

TRS TSE T-1 FS Clear
